

This listing of claims will replace all prior versions, and listings, of claims in the application:

Listing of Claims:

1. (Previously Presented) A processor unit for a shared-memory computer comprising:
- a processor unit;
 - a local memory system executing a protocol to share data with at least one other processor unit;
 - a conflicts resolution circuit executing a hardware program to:
 - (i) detect a critical section in an executing program and begin speculative execution of the critical section without acquisition of a lock;
 - (ii) in the event of a conflict with another processor unit executing the critical section and needing to write to data within the critical section, establishing a priority between the processor units to resolve the conflict without acquisition of the lock.
2. (Previously Presented) The processor unit of claim 1 further including:
- a globally unique clock;
 - and where the conflicts resolution circuit establishes a priority between the processor units by:
 - (a) time stamping requests for data sent by a first processor unit to other processor units with a value of the globally unique clock;
 - (b) releasing owned data requested by a second processor unit making a request with an earlier time stamp than a time stamp of a request to acquire ownership of the data by the first processor unit; and
 - (c) deferring release of owned data requested by a second processor unit making a request having a later time stamp than the time stamp of the request to acquire ownership of the data by the first processor unit.
3. (Original) The processor unit of claim 2 wherein the conflicts resolution circuit

executes hardware program step (i) only during execution of a critical section.

4. (Previously Presented) The processor unit of claim 2 wherein the conflicts resolution circuit defers to a protocol of the local memory during execution of a section of the program that is not a critical section.

5. (Original) The processor unit of claim 4 wherein the protocol of the local memory is a cache coherence protocol.

6. (Previously Presented) The processor unit of claim 2 wherein the globally unique clock includes a time variant field and a static processor-unit-dependant field.

7. (Previously Presented) The processor unit of claim 2 wherein the globally unique clock is a counter updated after executions by the processor of a critical section of a program subject to a lock.

8. (Original) The processor unit of claim 7 wherein the counter sets itself to a higher number on updating.

9. (Previously Presented) The processor unit of claim 8 wherein the counter sets itself to the time stamp of the request of the second processor unit when the release of data is deferred because the time stamp of the request of the second processor unit is later.

10. (Original) The processor unit of claim 1 further including buffer memory storing the deferred request of the other processor unit; and

wherein the conflicts resolution circuit further executes the hardware program to:

(iv) read the buffered deferred requests at a time after the deferring to release data to the other processor unit.

11. (Original) The processor unit of claim 10 further including:

a critical section detection circuit detecting the start and end of execution by the processor of a critical section of a program subject to a lock; and

wherein the later time is the completion of a critical section.

12. (Previously Presented) The processor unit of claim 2 wherein the conflicts resolution circuit further executes the hardware program to:

(iv) send a marker message to the second processor unit when the request by the second processor unit is deferred based on its time stamp.

13. (Previously Presented) The processor unit of claim 2 wherein the conflicts resolution circuit further executes the hardware program to:

(iv) send a marker message to the second processor unit when the request by the second processor unit is deferred because the requested data is not available.

14. (Original) The processor unit of claim 13 wherein the conflicts resolution circuit further executes the hardware program to:

(iv) send a probe message to a third processor unit containing a time stamp of the request of a second processor unit receiving the marker message.

15. (Original) The processor unit of claim 1 wherein the conflicts resolution circuit further executes the hardware program to:

(iv) respond to a probe message to a second processor unit that has sent the processor unit a marker message indicating that a request by the

processor unit has been deferred, the probe message indicating a time stamp of a third processor unit earlier than the time stamp of the request used by processor unit to acquire that data, the probe message being from a third processor unit requesting the data from the second processor unit.

16. (Original) The processor unit of claim 1 further including:

a lock elision circuit executing a hardware program to:

(i) detect the start of execution by the processor of a critical section of a program subject to a lock;

(ii) speculatively execute the critical section without acquiring the lock;

(iii) when a conflict for data of the critical section is detected, refer the conflict to the conflict resolution circuit, where the conflict is indicated by a request by another processor unit for data in the critical section owned by the processor unit; and

(iv) when no conflict for data of the critical section is detected, commit the execution of the critical section.

17. (Previously Presented) The processor unit of claim 16 wherein the conflict resolution circuit allows continued speculative execution of the critical section when the conflict is resolved by deferring the release of the data in hardware program step (iii).

18. (Previously Presented) The processor unit of claim 16 wherein the conflict resolution circuit causes a ceasing of the speculative execution of the critical section when the conflict is resolved by releasing the data in hardware program step (iii).

19. (Previously Presented) The processor unit of claim 16 further including buffer memory storing deferred requests from the second processor unit; and

wherein the conflicts resolution circuit further executes the hardware program to:

(iv) read the buffered deferred requests at a later time to release data to the second processor unit; and

(v) cease the speculative execution of the critical section when buffer memory is exhausted.

20. (Original) The processor unit of claim 16 including buffer memory storing the results of speculative execution; and

wherein the lock elision circuit further executes the hardware program to: (iv) cease the speculative execution of the critical section when buffer memory is exhausted.

21. (Previously Presented) A processor unit system comprising: a plurality of processor units having:

a processor unit;

a local memory system executing a protocol to share data with at least one other processor unit;

a globally unique clock;

a conflicts resolution circuit executing a hardware program to:

(i) time stamp requests for data sent by a first processor unit to other processor units with a value of the globally unique clock;

(ii) release owned data requested by a second processor unit making a request with an earlier time stamp than a time stamp of a request to acquire ownership of the data by the first processor unit;

(iii) defer release of owned data requested by a second processor unit making a request having a later time stamp than the time stamp of the request to acquire ownership of the data by the first processor unit.

22. (Previously Presented) A method of operating a set of processor units for a shared-memory computer comprising the steps of:

(a) generating on each processor unit a globally unique clock;

(b) time stamping all requests for data sent by a first processor unit to other processor units with a value of the globally unique clock;

(c) releasing owned data requested by a second processor unit making a request with an earlier time stamp than a time stamp of a request to acquire ownership of the data by the first processor unit; and

(d) deferring release of owned data requested by a second processor unit making a request having a later time stamp than the time stamp of the request to acquire ownership of the data by

the first processor unit.

23. (Original) A processor unit for a shared-memory computer comprising: a processor;
a local memory system executing a protocol to share data with at least one other
processor unit;

a conflicts resolution circuit executing a hardware program to resolve conflicts between
different processor units;

a lock elision circuit executing a hardware program to:

(i) detect the start of execution by the processor of a critical section of a program subject
to a lock;

(ii) speculatively execute the critical section without acquiring the
lock;

(iii) when a conflict for data of the critical section is detected, refer the conflict to the
conflict resolution circuit, where the conflict is indicated by a request by another processor unit
for data in the critical section owned by the processor unit; and

(iv) when no conflict for data of the critical section is detected, commit the execution of
the critical section.
